Sampling and Summary Statistics

Biology 683

Lecture 2

Heath Blackmon
Last week

- What are some causes of the reproducibility crisis?
- Common problems in plots?
1. Terminology
2. Summarizing Data
3. Central Limit Theorem
4. Covariance and Correlation
Populations and Samples

• **Populations**
  Some sort of group of something - could be anything
  • Undergraduates at Texas A&M
  • Jewel beetles in Arizona
  • Strain of flies in the lab

• **Samples**
  • A subset of individuals drawn from a population
What is the population?

We wanted to examine any association between the severity of injuries, and the height from which cats fall in high-rise buildings.

In the period between January 1, 1998 and December 12, 2001 at the Clinic of Surgery, Orthopedics and Ophthalmology of the Veterinary Faculty, 119 cats were treated after a fall or jump from a balcony or window, where the owners saw the fall, or where there was a reasonable suspicion that a fall had occurred. Only those cats that fell from the second or higher stories were included. The owners brought the cats for treatment within varying periods of time after the fall (from 30 min to over a month).

Sampling Considerations

Target population
• Need to sample a representative population
• A sample of people from College Station, for instance, would probably not be representative of New Yorkers

Sampling Error
• Chance alone will cause your sample to depart from the population
Parameter: Population-level variables we are trying to estimate

Estimate or Statistic: The value of the parameter inferred from the sample

Bias: If something about the sampling procedure causes the sample to systematically misrepresent the population.

Precision: How tightly grouped are the estimates?
Accuracy vs Precision

• Precision is a measure of spread

• Accuracy is a measure of bias
Random Sampling

1. Every unit in a population should have an equal chance of being sampled.

2. The selection of units must be independent.

3. Lots of ways of being non-random…
A statistical hypothesis is a specific claim about a population parameter

*Caloric restriction increases the lifespan of Drosophila melanogaster.*

*The rate of evolution in wingless species is higher than winged species.*

*Pesticide exposure causes feminization of amphibian males.*

*Repetitive DNA content is higher in venomous than nonvenomous reptiles*
Data

Variables
The characteristics that differ among individuals

Data
The measurements of variables taken for a sample of individuals

Categorical Variables
Individuals are in qualitative categories
Data

**Numerical Variables**
Individuals vary on a quantitative scale

**Ordinal**
The categories can be ordered

**Nominal**
The categories have no inherent order
Continuous vs Discrete

Continuous variables
a variable that has an infinite number of possible values

Discrete variables
a variable that has a finite number of possible values
Explanatory and Response Variables

\[ y = mx + b \]
\[ y \text{ is response variable} \]
\[ x \text{ is explanatory variable} \]
Experimental vs observational studies

- Does caloric restriction increase lifespan in mice?
- Is global warming caused by human activities?
- Does smoking cause lung cancer in humans?
- Does parasite infection reduce mating success of beetles?
- Does oxytocin affect sexual attraction in humans?
- Do sex chromosomes increase the rate of speciation?
Why should we summarize data?

• Many datasets are simply too big to look at all values and form an impression?

• Our impressions of small datasets are often misled by our tendency to look for patterns.
Typical summary statistics

- **Mean**: Sum of the observations divided by the number of observations
- **Median**: The middle observation in a set of data
- **Variance**: The average squared deviation from the mean
- **Standard Deviation**: The square root of the variance
Mean and variance

**Increase in mean**

- Density
- $N = 10000$, Bandwidth = 0.1438

**Increase in both**

- Density
- $N = 10000$, Bandwidth = 0.1438

**Increase in variance**

- Density
- $N = 10000$, Bandwidth = 0.1438
Box Plot

Interquartile Range
Box Plot

Range of all data
Box Plot

Data points more than 1.5 Interquartile ranges away from the median
Box Plot
Symbols for samples and populations

Samples versus Populations
The mean or standard deviation statistic you calculate from your sample is an estimate of the population parameter.

Parameter Symbols:
\( \mu \) : population mean
\( \sigma \) : population standard deviation

Statistic Symbols:
\( \bar{Y} \) : sample mean
\( s \) : samples standard deviation
For a sample of a population

The mean is just: $\bar{Y} = \frac{\sum_{i=1}^{n} Y_i}{n}$

The standard deviation is $s = \sqrt{s^2}$

Where $s^2$ or the variance is: $s^2 = \frac{\sum_{i=1}^{n} (Y_i - \bar{Y})^2}{n-1}$
Central limit theorem

- Imagine that we sample from the same population many times, so we have a bunch of different, independent samples.

- Each sample will have a mean, but the means will be different due to chance. In principle, we could draw a histogram of these means.

- In general, you only have one sample from a given population, however, so what can you infer about the distribution of the means from your sample?

- The Central Limit Theorem states that regardless of the underlying population distribution of the variable of interest, the distribution of the population of means will be roughly normal.
Central limit theorem

Your estimate of the sample mean is an estimate of the mean of this distribution of means (that is, it’s your best estimate of the population mean).

The hypothetical distribution of sample means has a standard deviation equal to s divided by the square root of n.

\[ SE_{\bar{Y}} = \frac{s}{\sqrt{n}} \]

We call this standard deviation the standard error of the mean (SEM).
Central limit theorem

Let's try that
Estimating with uncertainty

- 68.26% of area
- 95.44% of area
- 99.74% of area
• Error bars can be a useful way to show uncertainty when it’s not possible to show the actual data points.

• Usually, they represent 1 SE or the 95% CI, but not always.

• THE FIGURE LEGEND SHOULD INDICATE WHAT THE ERROR BARS REPRESENT!
For Thursday

1. Read chapters 3 WS

Bring laptop to class!

Heath Blackmon

coleoguy@gmail.com
Your turn

• Lets demonstrate that the means of samples from an exponential distribution are normally distributed.

You will need:
rexp, hist, mean

Might use:
for, sample
Box Plot

- **Median**: The middle value of the dataset.
- **Lower Quartile**: One fourth of the dataset.
- **Upper Quartile**: Three fourths of the dataset.
- **Minimum**: The smallest value in the dataset.
- **Maximum**: The largest value in the dataset.
- **Interquartile Range**: The difference between the Upper and Lower Quartiles.
- **Whisker**: Extends to the smallest and largest values within 1.5 times the interquartile range from the quartiles.
